## Streams

Define details for streaming audio.

**Streams**

SHOW ALL

SEARCH

Define details for streaming audio.

<input type="checkbox"/> Name	Play	Enabled	Description	
<input type="checkbox"/> Public Domain music	0:00 / 0:00	true	Public Domain music	
<input type="checkbox"/> Local Weather	0:00 / 0:00	true		

- Make sure mod\_shout is installed and is started.
  - Have a shoutcast url ready to use. (shout://domain.tld/path/to/)
  - To add a stream click the plus icon on the right
- Edit the fields:
    - Name: Can be anything
    - Location: Must start with shout://
    - Enabled: If you want the stream enabled
    - Domain: Choose a domain that will only have the stream. Choose Global for all domains
    - Description: To help organize ;-)

BACK

SAVE

Name	<input type="text" value="Monday Lunch Deals"/>
	Enter the name.
Location	<input type="text" value="shout://127.0.0.1/monday/specials"/>
	Enter the location.
Enabled	<input type="checkbox"/> True
	Enable or disable this stream.
Domain	<input type="text" value="Global"/>
Description	<input type="text" value="Lunch Deals"/>
	Enter the description.

SAVE

### Note

Editing a stream path will result in having to update anything that is using the stream. For example, if you have extension 500 using stream “Local Weather” and you edit the shout:// path then you will have to go back to extension 500 and reset the music on hold for extension 500. This is by design.
